

From an early age, I've wanted to be a founder. I wanted to build a company that drives real impact while also developing my own trading model to be implemented in real markets. At UC Berkeley, I plan to major in Computer Science or Engineering Math & Statistics, and explore interdisciplinary programs, as I believe data driven innovation can help others and make systems work more efficiently. Berkeley's culture and courses will equip me to build extraordinary projects and learn more about computational and data science coursework involving statistics.

As I plan to major in Mathematics or Computer Science, the number one public university in the United States, Berkeley would be my top choice since it offers outstanding resources. I hope to join the Undergraduate Research Apprentice Program (URAP) as a first-year student to help analyze data because I want to become a data scientist or work in quantitative finance. Additionally, the diversity of Berkeley's students will allow me to learn from peers with different backgrounds. Berkeley's autonomous culture fits me well. Even with large classes, I will join the Quantitative Finance Club, compete in data science competitions, and collaborate closely with professors on research projects, as UC Berkeley is renowned for its strong undergraduate research programs in Mathematics and Computer Science. Furthermore, Berkeley's Division of Computing, Data Science, and Society (CDSS) will provide the technical rigor I need.
